

Creating Date-Partitioned Tables in BigQuery

Task 1. Create a new dataset

1. First, you will create a dataset to store your tables.
2. Click the three dots next to your Qwiklabs project ID and select **Create dataset**:
3. Name your dataset **ecommerce**.
4. Click **Create dataset**.

Task 2. Creating tables with date partitions

A partitioned table is a table that is divided into segments, called partitions, that make it easier to manage and query your data. By dividing a large table into smaller partitions, you can improve query performance, and control costs by reducing the number of bytes read by a query.

Now create a new table and bind a date or timestamp column as a partition. Before we do that, let's explore the data in the non-partitioned table first.

Query webpage analytics for a sample of visitors in 2017

1. In the **Query Editor**, add the below query:

Solution:

The screenshot shows the Google Cloud BigQuery console interface. On the left, the Explorer pane shows the project 'qwklabs-gcp-04-a28277bd4ebe' with a dataset 'ecommerce' and a table 'partition_by_day'. The main area is the Query Editor, which contains a SQL query:

```
1 #standardSQL
2 SELECT DISTINCT
3   fullVisitorId,
4   date,
5   city,
6   pageTitle
7 FROM `data-to-insights.ecommerce.all_sessions_raw`
8 WHERE date = '20180708'
9 LIMIT 5
```

 The query has been executed, and the results pane shows 'There is no data to display.' The bottom of the screen shows the Windows taskbar with the date and time '16:28 30/12/2022'.

Query webpage analytics for a sample of visitors in 2018

Let's modify the query to look at visitors for 2018 now.

1. Click **COMPOSE NEW QUERY** to clear the **Query Editor**, then add this new query. Note the WHERE date parameter is changed to 20180708:

solution:

Common use-cases for date-partitioned tables

Scanning through the entire dataset everytime to compare rows against a WHERE condition is wasteful. This is especially true if you only really care about records for a specific period of time like:

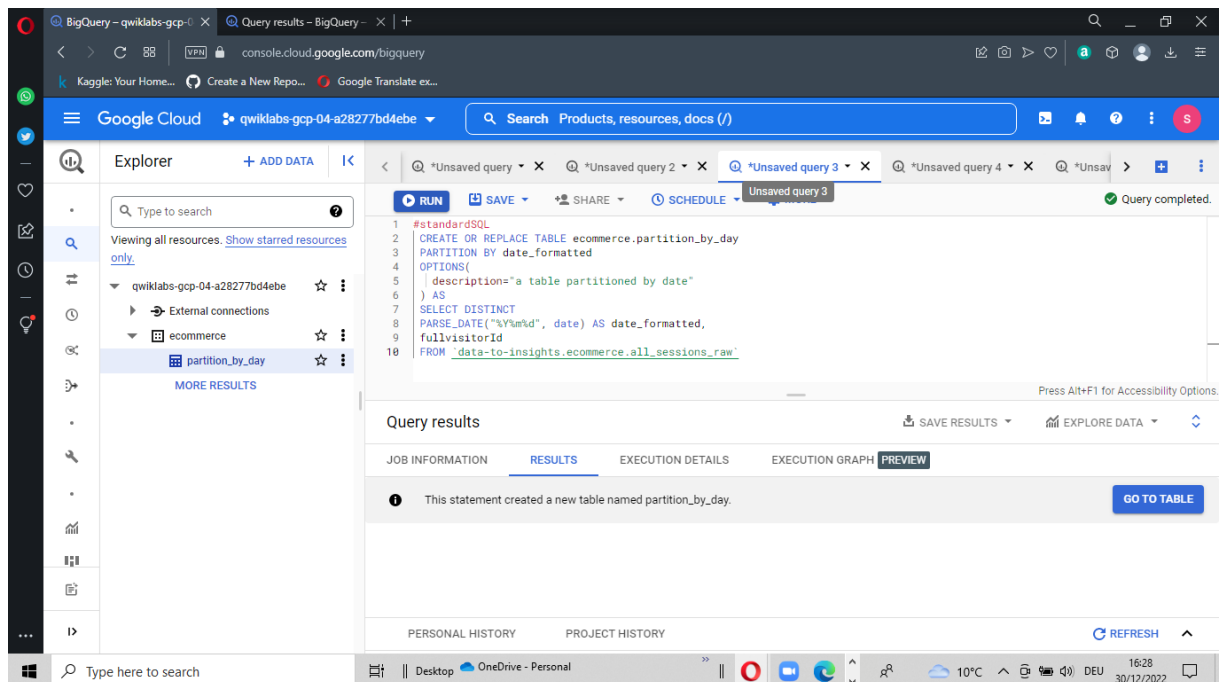

- All transactions for the last year
- All visitor interactions within the last 7 days
- All products sold in the last month

Instead of scanning the entire dataset and filtering on a date field like we did in the earlier queries, Now set up a date-partitioned table. This allows you to completely ignore scanning records in certain partitions if they are irrelevant to our query.

Create a new partitioned table based on date

1. Click **COMPOSE NEW QUERY** , add the query, then click **Run**:

solution:

The screenshot shows the Google Cloud BigQuery console interface. On the left, the Explorer pane shows the project 'qwiklabs-gcp-04-a28277bd4ebe' with a folder 'ecommerce' containing a table 'partition_by_day'. The main editor shows a SQL query for 'Unsaved query 3':

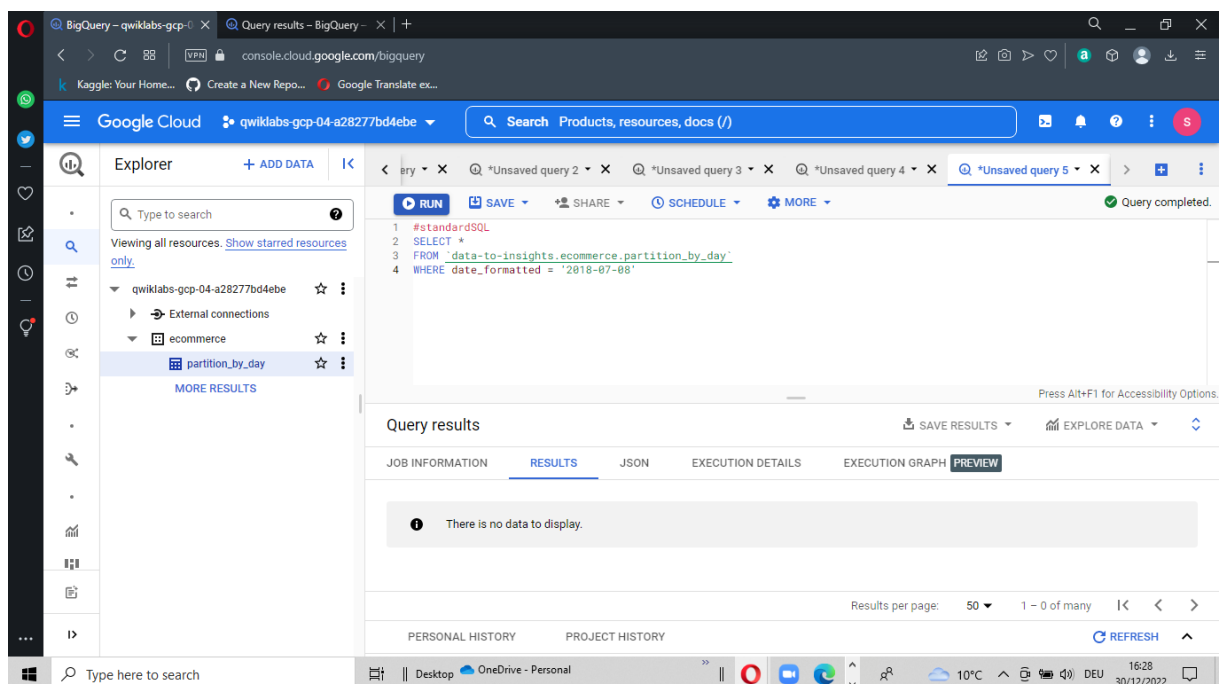

```
1 #standardSQL
2 CREATE OR REPLACE TABLE ecommerce.partition_by_day
3 PARTITION BY date_formatted
4 OPTIONS(
5   description="a table partitioned by date"
6 ) AS
7 SELECT DISTINCT
8   PARSE_DATE("%Y%m%d", date) AS date_formatted,
9   fullvisitorId
10  FROM `data-to-insights.ecommerce.all_sessions_raw`
```

The query results pane shows a message: "This statement created a new table named partition_by_day." with a 'GO TO TABLE' button. The status bar at the bottom indicates the query is completed.

In the above query, note the new option - PARTITION BY a field. The two options available to partition are DATE and TIMESTAMP. The PARSE_DATE function is used on the date field (stored as a string) to get it into the proper DATE type for partitioning.

Task 3. View data processed with a partitioned table

1. Run the query, and note the total bytes to be processed:

The screenshot shows the Google Cloud BigQuery console interface. The Explorer pane on the left shows the 'partition_by_day' table. The main editor shows a SQL query for 'Unsaved query 5':

```
1 #standardSQL
2 SELECT *
3 FROM `data-to-insights.ecommerce.partition_by_day`
4 WHERE date_formatted = '2018-07-08'
```

The query results pane shows a message: "There is no data to display." The status bar at the bottom indicates the query is completed.

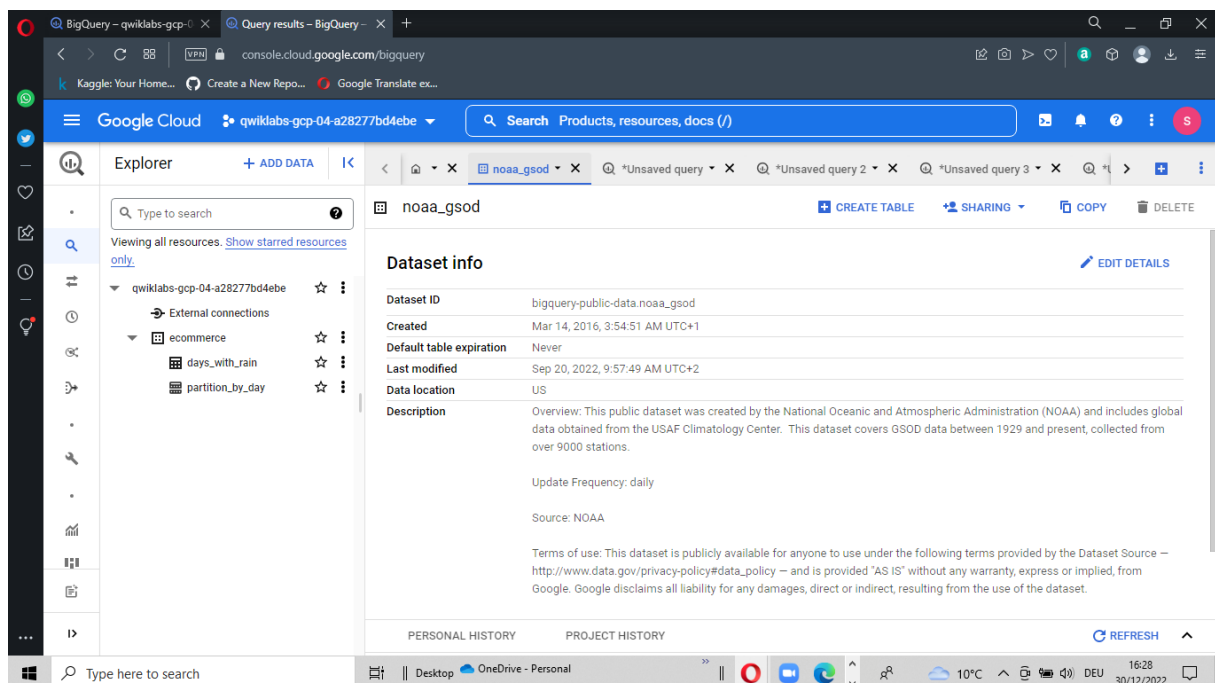

Task 4. Creating an auto-expiring partitioned table

Auto-expiring partitioned tables are used to comply with data privacy statutes and can be used to avoid unnecessary storage (which you'll be charged for in a production environment). If you want to create a rolling window of data, add an expiration date so the partition disappears after you're finished using it.

Explore the available NOAA weather data tables

1. In the left menu, in Explorer, click on **Add Data** and select **Explore public datasets**.

solution:

Your goal is to create a table that:

- Queries on weather data from 2018 onward
- Filters to only include days that have had some precipitation (rain, snow, etc.)
- Only stores each partition of data for 90 days from that partition's date (rolling window)

solution:

The screenshot shows the Google Cloud BigQuery console interface. On the left is the Explorer pane showing the project 'qwiklabs-gcp-04-a28277bd4ebe' and a dataset named 'ecommerce' with a table 'days_with_rain'. The main editor displays a SQL query that selects data from 'bigquery-public-data.noaa_gsod.stations' and 'bigquery-public-data.noaa_gsod.gsod*' (using a wildcard). The query filters for precipitation greater than 0 and orders results by date. Below the editor, the 'Query results' section shows a table with 5 rows of data for the date 2022-12-25, listing station names and precipitation values.

```
1 #standardSQL
2 SELECT
3   DATE(CAST(year AS INT64), CAST(mo AS INT64), CAST(da AS INT64)) AS date,
4   (SELECT ANY_VALUE(name) FROM `bigquery-public-data.noaa_gsod.stations` AS stations
5    WHERE stations.usaf = stn) AS station_name, -- Stations may have multiple names
6   prcp
7 FROM `bigquery-public-data.noaa_gsod.gsod*` AS weather
8 WHERE prcp < 99.9 -- Filter unknown values
9    AND prcp > 0 -- Filter stations/days with no precipitation
10    AND _TABLE_SUFFIX = '2018'
11 ORDER BY date DESC -- Where has it rained/snowed recently
12 LIMIT 10
```

Row	date	station_name	prcp
1	2022-12-25	PANGBORN MEM	0.05
2	2022-12-25	PORTLAND/HILLSBORO	0.6
3	2022-12-25	GRAND MARIAS	0.01
4	2022-12-25	BOISE AIR TERMINAL/GOWEN ...	0.08
5	2022-12-25	OMAK	0.05

NB: The table wildcard * used in the FROM clause to limit the amount of tables referred to in the `TABLE_SUFFIX` filter.

Task 5. create a partitioned table

- Modify the previous query to create a table with the below specifications:
 - Table name: `ecommerce.days_with_rain`
 - Use the date field as your `PARTITION BY`
 - For `OPTIONS`, specify `partition_expiration_days = 60`
 - Add the table description = "weather stations with precipitation, partitioned by day".

solution:

The screenshot shows the Google Cloud BigQuery console. The Explorer panel on the left shows the project 'qwklabs-gcp-04-a28277bd4ebe' and the dataset 'ecommerce' with tables 'days_with_rain', 'partition_by_day', and 'days_with_rain'. The query editor shows a SQL query that creates a table named 'days_with_rain' with a partition by date. The query results panel shows a message: 'This statement created a new table named days_with_rain.' The status bar at the bottom indicates the query is completed.

```
1 #standardSQL
2 CREATE OR REPLACE TABLE ecommerce.days_with_rain
3 PARTITION BY date
4 OPTIONS (
5   partition_expiration_days=60,
6   description="weather stations with precipitation, partitioned by day"
7 ) AS
8 SELECT
9   DATE(CAST(year AS INT64), CAST(mo AS INT64), CAST(da AS INT64)) AS date,
10  (SELECT ANY_VALUE(name) FROM `bigquery-public-data.noaa_gsod.stations` AS stations
11   WHERE stations.usaf = stn) AS station_name, -- Stations may have multiple names
12  prcp
```

Below is a query which tracks the average rainfall for the NOAA weather station in [Wakayama, Japan](#) which has significant precipitation.

solution:

The screenshot shows the Google Cloud BigQuery console. The Explorer panel on the left shows the project 'qwklabs-gcp-04-a28277bd4ebe' and the dataset 'ecommerce' with tables 'days_with_rain', 'partition_by_day', and 'days_with_rain'. The query editor shows a SQL query that calculates the average monthly precipitation for the NOAA weather station in Wakayama, Japan. The query results panel shows a table with 4 rows of data. The status bar at the bottom indicates the query is completed.

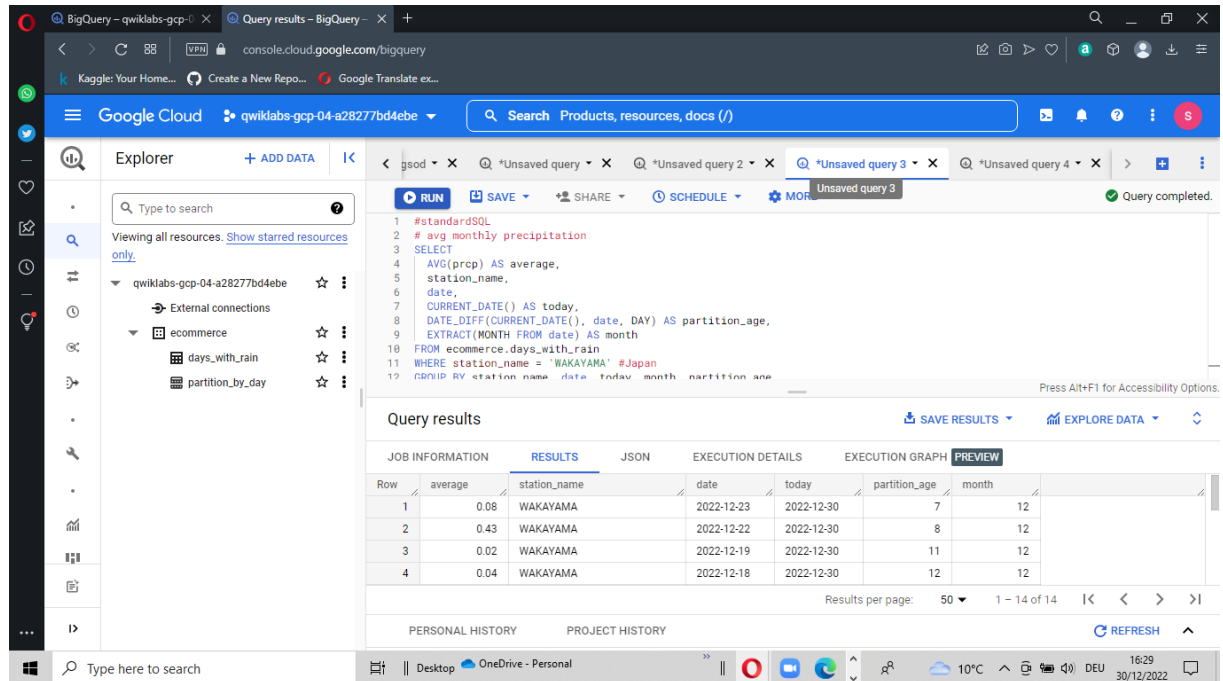

```
1 #standardSQL
2 # avg monthly precipitation
3 SELECT
4   AVG(prcp) AS average,
5   station_name,
6   date,
7   CURRENT_DATE() AS today,
8   DATE_DIFF(CURRENT_DATE(), date, DAY) AS partition_age,
9   EXTRACT(MONTH FROM date) AS month
10 FROM ecommerce.days_with_rain
11 WHERE station_name = 'WAKAYAMA' #Japan
12 GROUP BY station_name, date, today, month, partition_age
```

Row	average	station_name	date	today	partition_age	month
1	0.08	WAKAYAMA	2022-12-23	2022-12-30	7	12
2	0.43	WAKAYAMA	2022-12-22	2022-12-30	8	12
3	0.02	WAKAYAMA	2022-12-19	2022-12-30	11	12
4	0.04	WAKAYAMA	2022-12-18	2022-12-30	12	12

Task 6. Confirm the oldest partition_age is at or below 60 days

Update the ORDER BY clause to show the oldest partitions first

Solution:

The screenshot shows the Google Cloud BigQuery console interface. The left sidebar contains the Explorer panel with a search bar and a list of resources under the project 'qwiklabs-gcp-04-a28277bd4ebe', including 'External connections', 'ecommerce', 'days_with_rain', and 'partition_by_day'. The main panel displays a SQL query in the editor, which is a standard SQL query to calculate the average precipitation for the station 'WAKAYAMA' in Japan, partitioned by date, today, and month. The query is executed, and the results are shown in a table format. The table has columns for Row, average, station_name, date, today, partition_age, and month. The results show four rows of data for the station 'WAKAYAMA'.

```
1 #standardSQL
2 # avg monthly precipitation
3 SELECT
4   AVG(prcp) AS average,
5   station_name,
6   date,
7   CURRENT_DATE() AS today,
8   DATE_DIFF(CURRENT_DATE(), date, DAY) AS partition_age,
9   EXTRACT(MONTH FROM date) AS month
10 FROM ecommerce.days_with_rain
11 WHERE station_name = 'WAKAYAMA' #Japan
12 GROUP BY station_name, date, today, month, partition_age
```

Row	average	station_name	date	today	partition_age	month
1	0.08	WAKAYAMA	2022-12-23	2022-12-30	7	12
2	0.43	WAKAYAMA	2022-12-22	2022-12-30	8	12
3	0.02	WAKAYAMA	2022-12-19	2022-12-30	11	12
4	0.04	WAKAYAMA	2022-12-18	2022-12-30	12	12
